

Compare time intervals to find the metric delta

Published: 2018-10-09

Comparing metrics between two different time intervals helps you see the difference, or the delta, in metric data side-by-side in the same chart. If you create a delta comparison and navigate to another area of the Discover appliance, the comparison is disabled temporarily. When you return to your original page, the delta comparison you saved is enabled again.

1. Find a chart with the metrics that you want to compare.
2. In the upper left hand corner of the navigation bar, click the time interval.
3. In the Time Interval tab, click **Compare**.
4. In the Delta Comparison tab, select the time interval to compare with the original time interval.

The screenshot shows a configuration panel for a chart. It has two tabs: "Delta Comparison" and "Time Interval".

Delta Comparison Tab:

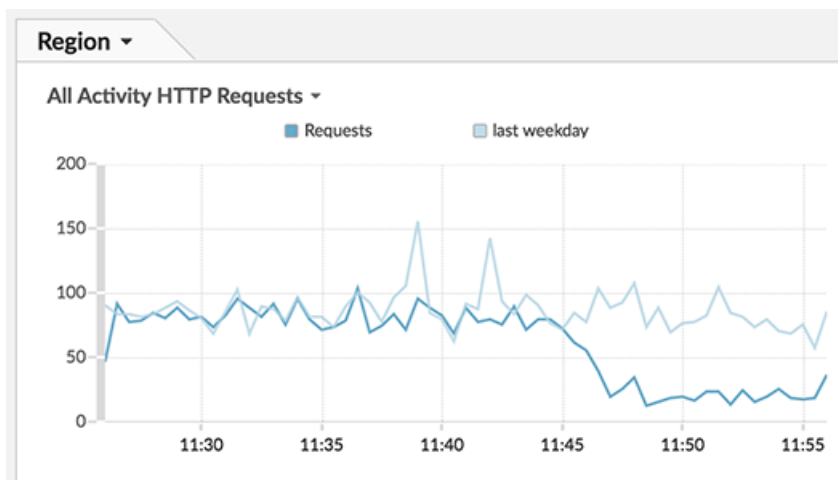

- Yesterday
- Last weekday
- A week ago
- A month ago
- Ending ago
- Custom ending time

Time Interval Tab:

- Last 30 minutes
- Last 6 hours
- Last day
- Last week
- Last
- Custom time range

Buttons at the bottom: "Remove Delta", "Cancel", and "Save".

5. Click **Save**. New metric data from the Delta Comparison time interval is placed on the original chart.

6. To remove the delta comparison, complete the following steps:
 - a) Click the time interval.
 - b) Click **Remove Delta**.
 - c) Click **Save**.

Note: Dynamic baselines will not appear on a chart when you are comparing metric deltas.
