

Create a device group through the REST API

Published: 2024-02-23

You can create a large number of complex device groups through the REST API by referencing a CSV file exported from a third-party application. In this topic, we show methods for creating a device group through both the ExtraHop REST API Explorer and a Python script.

Before you begin

- For sensors and ECA VMs, you must have a valid API key to make changes through the REST API and complete the procedures below. (See [Generate an API key](#).)
- For Reveal(x) 360, you must have valid REST API credentials to make changes through the REST API and complete the procedures below. (See [Create REST API credentials](#).)

Create a device group through the REST API Explorer

- In a browser, navigate to the REST API Explorer.

The URL is the hostname or IP address of your sensor or console, followed by `/api/v1/explore/`.

For example, if your hostname is seattle-eda, the URL is `https://seattle-eda/api/v1/explore/`.

- Click **Enter API Key** and then paste or type your API key into the **API Key** field.

- Click **Authorize** and then click **Close**.

- Click **Device Group** and then click **POST /devicegroups**.

- Click **Try it out**.

The JSON schema is automatically added to the body parameter text box.

- In the body field, specify properties for the device group that you want to create.

For example, the following body creates a device group that includes CIDR blocks `192.168.0.0/26`, `192.168.0.64/27`, and `192.168.0.96/30`:

```
{  
    "name": "New group",  
    "description": "A newly created group",  
    "filter": {  
        "rules": [  
            {  
                "field": "ipaddr",  
                "operand": "192.168.0.0/26",  
                "operator": "="  
            },  
            {  
                "field": "ipaddr",  
                "operand": "192.168.0.64/27",  
                "operator": "="  
            },  
            {  
                "field": "ipaddr",  
                "operand": "192.168.0.96/30",  
                "operator": "="  
            }  
        ],  
        "operator": "or"  
    }  
}
```

- Click **Send Request**.

Retrieve and run the example Python script

The ExtraHop GitHub repository contains an example Python script that creates device groups by reading criteria from a CSV file that meets the following specifications:

1. Go to the [ExtraHop code-examples GitHub repository](#) and download the `create_device_groups/create_device_groups.py` file to your local machine.
2. In the directory you copied the `create_device_groups.py` to, create a CSV file that meets the following specifications:
 - The CSV file must not contain a header row.
 - Each row of the CSV file must contain the following three columns in the specified order:

Device group name	Description	IP address or CIDR block
-------------------	-------------	--------------------------

- Each column after the first required three columns must specify an IP address or CIDR block for the device group.

Note: You cannot specify more than 1000 IP addresses or CIDR blocks for a device group.

Note: For an example of a compatible CSV file, see the `create_device_groups/device_group_list.csv` file in the ExtraHop code-examples GitHub repository.

3. In a text editor, open the `create_device_groups.py` file and replace the configuration variables with information from your environment.
 - For sensors and ECA VMs, specify the following configuration variables:
 - **HOST:** The IP address or hostname of the sensor or ECA VM.
 - **API_KEY:** The API key.
 - **CSV_FILE:** The file that contains the list of device groups.
 - For Reveal(x) 360, specify the following configuration variables:
 - **HOST:** The hostname of the Reveal(x) 360 API. This hostname is displayed in the Reveal(x) 360 API Access page under API Endpoint. The hostname does not include the `/oauth2/token`.
 - **ID:** The ID of the Reveal(x) 360 REST API credentials.
 - **SECRET:** The secret of the Reveal(x) 360 REST API credentials.
 - **CSV_FILE:** The file that contains the list of device groups.
4. Run the following command:

```
python create_device_groups.py
```

Note: If the script returns an error message that the SSL certificate verification failed, make sure that [a trusted certificate has been added to your sensor or console](#). Alternatively, you can add the `verify=False` option to bypass certificate verification. However, this method is not secure and not recommended. The following code sends an HTTP GET request without certificate verification:

```
requests.get(url, headers=headers, verify=False)
```
