

# Configure a trend alert

Published: 2022-07-07

Configure a trend alert to monitor when a specific metric deviates from normal trends. Trend alerts are useful for monitoring metric trends such as unusually high round-trip times or storage servers experiencing abnormally low traffic, which might indicate a failed backup. For example, you can configure a trend alert that generates alerts when a spike (75th percentile) in HTTP web server processing time lasts longer than 10 minutes, and where the metric value of the processing time is 100% higher than the trend.

## Before you begin

You must have [full write privileges](#) or higher.

1. Log in to the ExtraHop system through `https://<extrahop-hostname-or-IP-address>`.
2. Click the System Settings icon  and then click **Alerts**.
3. Click **Create**.
4. Type a unique name for the alert configuration in the **Name** field.
5. In the **Description** field, add information about the alert.

**Tip:** Alert descriptions support Markdown, which is a simple formatting syntax that converts plain text into HTML. For more information, see the [Alerts FAQ](#).

6. In the **Alert Type** section, click **Trend Alert**.
7. In the **Assigned Sources** field, type the name of a device, device group, or application and then select from the search results.

To search for a site, flow network, or flow interface, select that source type from the drop-down menu at the top of the search results.

8. Optional: Click **Add Source** to assign the alert to multiple sources. Multiple sources must be of the same type, such as only devices and device groups or only applications.

**Tip:** Assign an alert to a device group to efficiently manage assignments to multiple devices.

9. In the **Monitored Metric** field, type the name of a metric and then select from the search results. The metric must be compatible with the assigned sources. For example, if you assign the alert to an application, you cannot select a device metric.

If you select a dataset metric such as HTTP Server Processing Time, you must specify one of the following data aggregation methods:

Merge	Aggregate all the metric dataset values and apply the trend weighting model to one superset of data.  For example, a 30-second aggregated rollup, or metric cycle, contains a single dataset for each 30-second interval. Therefore, a 30-minute interval has 60 datasets.
Mean	Aggregate the mean of each metric dataset.
Percentile	Aggregate the percentile of each metric dataset based on the value you specify for <b>Percentile</b> .
Absolute Standard Deviation	Aggregate the metric dataset to its standard deviation as a constant.

---

Relative Standard Deviation

Aggregate the metric dataset to its standard deviation relative to the mean.

---

10. Optional: To monitor the value of a metric divided by a secondary metric, click **Ratio** and then select a secondary metric.

For example, divide HTTP response errors by HTTP responses to monitor trends in the percentage of HTTP errors.

11. In the Trend Definition section, specify how the trend is calculated:

- a) From the Trend Weighting Model drop-down list, select a model. The weighting model aggregates historical metric values to calculate a trend.

Mean	Calculate a trend by averaging all metric values, weighted equally.
Minimum Value	Calculate a trend from the lowest value metrics.
Median Value	Calculate a trend from the median historical metric values.
Maximum Value	Calculate a trend from the highest value metrics.
Percentile	Calculate a trend from the percentile of each metric based on the value you specify for <b>Percentile Value</b> .
Absolute Standard Deviation	<p>Calculate a trend by comparing the standard deviation as a constant value to the current trend.</p> <p>From the <b>Deviation Type</b> drop-down list, select a type:</p> <ul style="list-style-type: none"> <li>• Sample-based</li> <li>• Population-based</li> </ul>
Relative Standard Deviation	<p>Calculate a trend by comparing the standard deviation as a value relative to the mean of the current trend.</p> <p>From the <b>Deviation Type</b> drop-down list, select a type:</p> <ul style="list-style-type: none"> <li>• Sample-based</li> <li>• Population-based</li> </ul>
Linear Regression	Calculate a linear trend based on previous metric values.

2nd Degree Polynomial Regression	<p>Calculate a quadratic trend by projecting a curve with the following equation: <math>y=ax^2+bx+c</math></p>
Single Exponential Mean	<p>Calculates a trend by averaging weight-based metric values.</p> <p>In the <b>Recent Value Weight Calculation</b> field, specify a large number to give more weight to the most recent metric values or specify a small number to give more weight to the oldest metric values.</p>
Double Exponential Mean	<p>Calculates a trend by averaging weight-based metric values.</p> <p>In the <b>Recent Value Weight Calculation</b> field, specify a large number to give more weight to the most recent metric values or specify a small number to give more weight to the oldest metric values.</p> <p>Note that double exponential mean calculations are more accurate for predicting the trend trajectory.</p>
Static Value	<p>Calculate a trend based on a static metric value compared to a metric calculation.</p> <p>Specify a static value and select a metric calculation:</p> <ul style="list-style-type: none"> <li>• Rate per hour</li> <li>• Rate per minute</li> <li>• Count</li> </ul> <p>This model is useful to plot constant lines for SLAs.</p>
Trimean	<p>Calculate a trend based on the weighted average of the 25th, 50th, and 75th percentile metric values.</p>
Time Delta	<p>Calculate a trend by comparing current metric values to historical data.</p>
Winsorized Mean	<p>Calculate a trend by retrieving metric values at specified low and high percentages and replacing them with the lowest and highest remaining values.</p> <p>For example, metric values above the 90th percentile become the same value as the 90th, and metric values below the 10th percentile become the same value as the 10th.</p> <p>From the <b>Winsorization</b> drop-down list, select a percentage pair:</p> <ul style="list-style-type: none"> <li>• 5/95th Percentile</li> <li>• 10/90th Percentile</li> </ul>

- 25/75th Percentile

b) From the **Trend Window** drop-down list, select a calculation window.

Same Hour of Week	Calculate a trend by comparing metrics gathered from the same 1-hour window each week.
Same Hour of Day	Calculate a trend by comparing metrics gathered from the same 1-hour window each day.
Minute Rolling Average	Calculate a trend by averaging metric values gathered each minute within a specified amount of time from the present time.
Hour Rolling Average	Calculate a trend by averaging metric values gathered each hour within a specified amount of time from the present time.

c) In the **Trend Lookback** field, specify the time window of historical data the ExtraHop system will review to calculate the trend. Valid lookback values are determined by the selected Trend Window.

- Specify a value between 1-45 days if Same Hour of Day is selected.
- Specify a value between 1-15 weeks if Same Hour of Week is selected.
- Specify a value between 1-48 hours if Hour Rolling Average is selected.
- Specify a value between 1-999 minutes if Minute Rolling Average is selected.

12. In the Alert Condition section, specify conditions for generating an alert.

- a) From the **Match All** drop-down list, select an option to generate an alert when all, any, or none of the alert conditions are met.
- b) Select a metric calculation to specify how to calculate the metric value within the time interval.

Mean	Calculate the mean value of the metric.
Median	Calculate the 50th percentile value of the metric.
25th Percentile	Calculate the 25th percentile value of the metric.
75th Percentile	Calculate the 75th percentile value of the metric.
Standard Deviation	Calculate the standard deviation compared to the metric. The standard deviation is the amount of variation from the trend.

Count	Specify the absolute total of the metric. No measurement is required.
-------	---

- c) Select the time interval over which the metric value is observed. You can select an interval from 30 seconds up to 30 minutes.
- d) Select an operator to specify how the metric calculation is compared to the metric value.
- e) Specify the metric value to compare to the metric calculation.
- f) Specify how to measure the metric value.

- Percent of trend
- Absolute
- Per second
- Per minute

- g) Optional: Click **Add Condition** to add more condition criteria or click **Add Condition Group** to nest condition criteria.

For example, to generate an alert when the standard deviation of the observed metric over a 60 minute interval is equal to a trend value of 25%, specify the following conditions:

- Metric Calculation: Standard Deviation
- Time Interval: 60m
- Operator: =
- Metric Value: 125
- Measurement: percent of trend

- 13. Optional: In the Notifications section, [add an email notification to an alert](#) to receive emails or SNMP traps when an alert is generated. (Reveal(x) Enterprise only.)
- 14. In the Status section, click an option to enable or disable the alert.
- 15. Optional: [Add an exclusion interval](#) to suppress alerts during specific times.
- 16. Click **Save**.
