

Create a certificate signing request from your ExtraHop system

Published: 2024-04-01

A certificate signing request (CSR) is a block of encoded text that is given to your Certificate Authority (CA) when you apply for an SSL certificate. The CSR is generated on the ExtraHop system where the SSL certificate will be installed and contains information that will be included in the certificate such as the common name (domain name), organization, locality, and country. The CSR also contains the public key that will be included in the certificate. The CSR is created with the private key from the ExtraHop system, making a key pair.

- 1. Log in to the Administration settings on the ExtraHop system through https://extrahop-hostname-or-IP-address>/admin.
- 2. In the Network Settings section, click **SSL Certificate**.
- 3. Click Manage certificates and then click Export a Certificate Signing Request (CSR).
- 4. In the Subject Alternative Names section, type the DNS name of the ExtraHop system. You can add multiple DNS names and IP addresses to be protected by a single SSL Certificate.
- 5. In the Subject section, complete the following fields. Only the Common Name field is required.

*.example.com discover.example.com
webmaster@example.com
IT Department
Example, Inc.
Seattle
Washington
US
- E

6. Click **Export**. The CSR file is automatically downloaded to your computer.

Next steps

Send the CSR file to your certificate authority (CA) to have the CSR signed. When you receive the SSL certificate from the CA, return to the SSL Certificate page in the Administration settings and upload the certificate to the ExtraHop system.

Tip: If your organization requires that the CSR contains a new public key, generate a self-signed certificate ☑ to create new key pairs before creating the CSR.
