

Detections

Published: 2024-01-26

The ExtraHop system applies machine learning techniques and rule-based monitoring to your wire data to identify unusual behaviors and potential risks to the security and performance of your network.

Before you begin

Users must be granted [privileges](#) to view detections.

When anomalous behavior is identified, the ExtraHop system generates a detection and displays the available data and options. Controls on the Detections page surface detections that are [recommended for triage](#) and help you [filter and sort](#) your views, so you can quickly focus on detections related to critical systems first.

With NPM module access, detections can help you maintain your network in the following ways:

- Collect high-quality, actionable data to find the root causes behind network issues.
- Find unknown issues with performance or infrastructure.

With NDR module access, detections can help you defend your network in the following ways:

- Identify malicious behavior that is associated with different attack categories or MITRE techniques.
- View related detections or create your own [investigation](#) to group detections and track potential attack campaigns.
- Flag suspicious IP addresses, hostnames, and URIs identified by threat intelligence.
- Highlight security hardening best practices.

Learn more about [optimizing detections](#).

- ⚠ **Important:** Although detections can inform you about security risks and performance issues, detections do not replace decision-making or expertise about your network. Always review [security](#) and [performance](#) detections to determine the root cause of unusual behavior and when to take action.

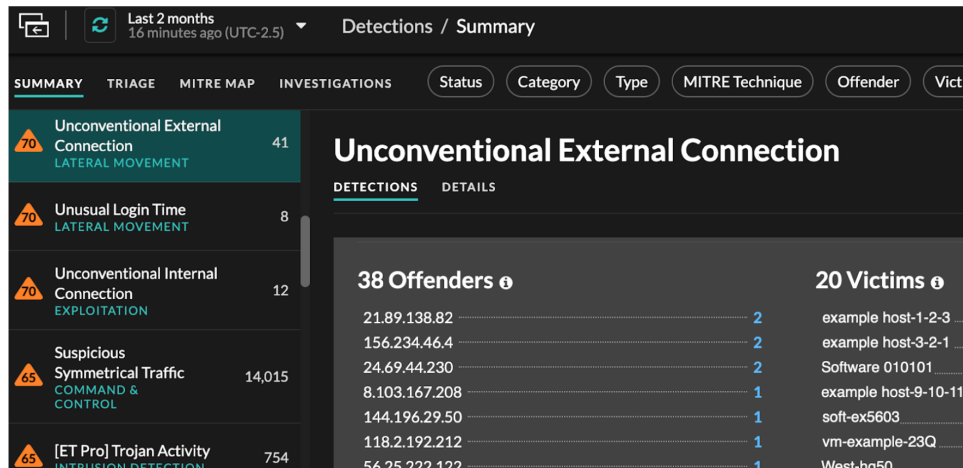

Viewing detections

In the upper left corner of the Detections page, there are four options for viewing detections: Summary, Triage, MITRE Map, and Investigations. These options each provide a unique view of your detections list.

Summary

By default, detections on the Detections page appear in Summary view, which aggregates information about detections to highlight patterns of activity in your environment. You can sort and group your detections list in Summary view to focus on frequently appearing detection types and the most active participants.

-  **Note:** By default, the **Open** status filter is applied to the Detections page. Click the **Open** filter to access other [filter options](#).

Sorting detections in Summary view

You can sort detections by either the highest risk score or most recent occurrence.

When sorted by Risk Score, detections that are [recommended for triage](#) appear first, followed by detections with the highest risk score.

When sorted by **Most Recent**, detections with the most recent end time appear first. If two detections are still ongoing, the detection with the most recent update time appears first. Click the sort icon above the detections list to select an option.

Grouping detections in Summary view

You can group detections by the type of detection (such as Spike in SSH Sessions) or by detection source (such as offender IP address), or you can choose to not group your detections list at all.

Group by Type

When grouping the Summary view by **Type**, you can view lists of values associated with detections that occurred during the selected time interval, such as participants, detection properties, or network localities.

You can click participant values to learn more about that device or IP address. Click any value to view only detections associated with that value, or [track all associated detections](#).

Participants

Lists all offenders and victims in the selected detection type. The Offender and Victim lists are ordered by the number of detections in which the participant appears.

Property Values

Lists the property values associated with the detection type. The Property Values list is ordered by the number of detections in which the property value appears.

Network Localities

Lists the network localities that contain detections of the selected type. The Network Localities list is ordered by the number of detections in the network locality.

At the bottom of the summary panel are links that enable you to [track all detections](#) included in the summary. You can [create a tuning rule](#) to hide all detections included in the summary or view hidden detections of that detection type.

You can scroll past the summary panel to view individual detection cards. Detections that are [recommended for triage](#) appear first.

Group by Source

When grouping the Summary view by Source, you can view participants that are the source of a detection, with the number of detections displayed next to the participant name. Click on a source to display the detections the device appeared in as either an offender or victim. Click **Details** under the device name to view a list of the detection types that the device appeared in, then click a detection type to filter by that detection type.

The screenshot shows the 'Detections / Summary' page with the view grouped by source. On the left, a list of participants is shown: 'wbsserver10' (13 detections), 'GP20 1998mVp' (11 detections), and 'PCUser10' (7 detections). The 'PCUser10' entry is selected. The central panel shows a detection card for 'PCUser10' with the title 'SSL/TLS Connection to a Suspicious Host' and a risk score of 60. The card includes a description: 'PCUser10 Initiated an SSL/TLS connection that included a suspicious hostname in the Server Name Indication (SNI) TLS extension. This host is considered suspicious based on threat intelligence found in your ExtraHop system. Confirm whether PCUser10 is the victim of a malware or phishing attack.' Below this, it lists the suspicious hostname 'hostname.com' and identifies 'PCUser10' as the 'OFFENDER'. The 'Details' panel on the right shows a 'Detections by Type' list: '[ET Pro] Trojan Activity' (1), '[ET Pro] Bad Unknown Traffic' (2), 'Weak Cipher Suite' (1), '[ET Pro] Attempted Admin' (1), 'SSL/TLS Connection to a Suspicious Host' (1), and 'DNS Request to a Suspicious Host' (1).

Group by None

When grouping by **None** on the Detections page, you can view a timeline chart of the total number of detections identified within the selected time interval. Each horizontal bar in the chart represents the duration of a single detection and is color-coded according to the risk score.

- Click and drag to highlight an area on the chart to zoom in on a specific time range. Detections are listed for the new time interval.
- Hover over a bar to view the detection risk score.
- Click a bar to navigate directly to the detection detail page.

Beneath the timeline, a flow chart displays the number of detections that are associated with each attack category. Categories are assembled into an attack chain that characterizes the progression of steps an attacker takes to ultimately achieve their objective, such as stealing sensitive data. Click an attack category to only display detections in that category.

Triage

(NDR module only) The Triage view surfaces detections that ExtraHop recommends for triage based on contextual analysis of factors in your environment.

Detection cards that are recommended for triage are marked with a yellow tag and list the factors that led to the recommendation.

Involves a high value asset

The asset provides authentication or essential services, or an asset that was [manually identified as high value](#).

Involves a top offender

The device or IP address has participated in numerous detections and a variety of detection types.

Involves a rare detection type

The detection type has no recent history of appearing in your environment. Uncommon detection types can indicate unique, malicious behavior.

Detections recommended for triage are prioritized in Summary view and appear at the top of your detections list regardless of sorting.

You can [filter detections](#) to display only detections that are recommended for triage and include Recommended for Triage as criteria for a [notification rule](#).

Here are some considerations about recommendations for triage:

- Recommendations based on high value assets are limited to a maximum of five detections of the same detection type over a two week period.
- Two weeks of sensor data is required before recommendations are made based on top offender or rare detection type factors.

MITRE map

Click the **MITRE Map** view if you want to display your detections by attack technique.

Each tile in the matrix represents an attack technique from the MITRE ATT&CK® Matrix for Enterprise. If a tile is highlighted, the detection associated with that technique occurred during the selected time interval. Click any tile to see detections that match that technique.

Investigations Table

The Investigations view displays all created investigations.

Click an investigation name to open the investigation. Learn more about [Investigations](#).

Filtering detections

You can filter the Detections page to display only the detections that match your specified criteria. For example, you might only be interested in exfiltration detections that occur over HTTP, or detections associated with participants that are important servers.

Status

You can filter detections with a specific detection status, such as Acknowledged, In Progress, or Closed. By default, the **Open** status filter is applied to the Detections page. Click the **Open** filter to access other filter options.

You can select the **Hidden** status to only show detections that are [currently hidden](#) by [tuning rules](#).

Category

You can filter by Attack or Operations detections, or you can select a more specific category to further refine your view of the Detections page. When you click the Category filter, most categories listed under the **All Attack Categories** and **All Operations Categories** options are sorted by the number of detections in the category. Hardening detections always appear at the end of the list.

Attack detections include the following categories that match phases of the attack chain.

Command & Control

An external server that has established and maintained connection to a compromised device on your network. C&C servers can send malware, commands, and payloads to support the attack. These detections identify when an internal device is communicating with a remote system that appears to be acting as a C&C server.

Reconnaissance

An attacker is seeking high-value targets and weaknesses to exploit. These detections identify scans and enumeration techniques.

 **Note:** Detections might identify a known vulnerability scanner such as Nessus and Qualys. Click the device name to confirm if the device is already assigned a Vulnerability Scanner role in the ExtraHop system. To learn how to hide detections related to these devices, see [Tune detections](#).

Exploitation

An attacker is taking advantage of a known vulnerability on your network to actively exploit your assets. These detections identify unusual and suspicious behaviors associated with exploitation techniques.

Lateral Movement

An attacker has infiltrated your network and is moving from device to device in search of higher-value targets. These detections identify unusual device behavior associated with east-west corridor data transfers and connections.

Actions on Objective

The attacker is close to achieving their objective, which can vary from stealing sensitive data to encrypting files to ransom. These detections identify when an attacker is close to completing a campaign objective.

Caution

Highlight activity that does not present an imminent threat to operations, but should be addressed to sustain a healthy security posture. These detections also identify activity by suspicious participants that are associated with threat intelligence.

Operation detections include the following categories.

Authentication & Access Control

Highlight unsuccessful attempts by users, clients, and servers to log in or access resources. These detections identify potential WiFi issues over authentication, authorization, and audit (AAA) protocols, excessive LDAP errors, or uncover resource-constrained devices.

Database

Highlight access problems for applications or users based on analysis of database protocols. These detections identify database issues, such as database servers that are sending an excessive number of response errors that might cause slow or failed transactions.

Desktop & App Virtualization

Highlight long load times or poor quality sessions for end users. These detections identify application issues, such as an excessive number of Zero Windows, which indicates that a Citrix server is overwhelmed.

Network Infrastructure

Highlight unusual events over the TCP, DNS, and DHCP protocols. These detections might show DHCP issues that are preventing clients from obtaining an IP address from the server, or reveal that services were unable to resolve hostnames due to excessive DNS response errors.

Service Degradation

Highlight service issues or performance degradation associated with Voice over IP (VoIP), file transfer, and email communications protocols. These detections might show service degradations where VoIP calls have failed and provide the related SIP status code, or show that unauthorized callers have attempted to make several call requests.

Storage

Highlight problems with user access to specific files and shares found when evaluating network file system traffic. These detections might show that users were prevented from accessing files on Windows servers due to SMB/CIFS issues, or that network-attached storage (NAS) servers could not be reached due to NFS errors.

Web Application

Highlight poor web server performance or issues observed during traffic analysis over the HTTP protocol. These detections might show that internal server issues are causing an excessive number of 500-level errors, preventing users from reaching the applications and services they need.

Hardening detections identify security risks and opportunities to improve your security posture.

Hardening

Highlight security hardening best practices that should be enforced to mitigate the risk of exploitation. These detections identify opportunities to improve the security posture of your network, such as preventing credential exposure and removing expired SSL/TLS certificates from servers. After you click a hardening detection, you can apply additional filters to view specific detections within that hardening detection type. Learn more about [filtering and tuning hardening detections](#).

Intrusion Detection System (IDS) detections identify security risks and malicious behavior.

Intrusion Detection

Highlight network traffic that matches known signatures of unsafe practices, exploit attempts, and indicators of compromise related to malware and command-and-control activity.

 **Important:** While IDS detections include links to packets for all protocol types, links to records are only available for L7 protocols.

Type

Filter your detection list by a specific detection type, such as Data Exfiltration or Expired SSL Server Certificates. You can also type a CVE identification number into this filter to only show detections for a specific public security vulnerability.

MITRE Technique

Highlight detections that match specific MITRE technique IDs. The MITRE framework is a widely recognized knowledgebase of attacks.

Offender and Victim

The offender and victim endpoints associated with a detection are known as participants. You can filter your detection list to only show detections for a specific participant, such as an offender that is an unknown remote IP address, or a victim that is an important server. Gateway or load balancer devices that are associated with external endpoint participants can also be specified in these filters.

Assignee

Filter detections by the user assigned to the detection.

More Filters

You can also filter your detections by the following criteria:

- [Recommended for Triage](#)
- [Device roles](#)
- Source
- Site (console only)
- Ticket ID filter ([Third-party ticketing systems](#) only)
- Minimum Risk Score

Navigating detections

After you select how to view, group, and filter your detections list, click any detection card to navigate to the detection detail page.

Detection cards

Each detection card identifies the cause of the detection, the detection category, when the detection occurred, and the victim and offender participants. Security detections include a risk score.

The screenshot shows a detection card for "VPN Client Data Exfiltration" with a risk score of 70. The card is divided into several sections:

- Risk score and attack chain phase:** Shows a risk score of 70 (orange icon) and the category "EXFILTRATION. ACTIONS ON OBJECTIVE".
- Timestamp and duration:** Shows "May 24 08:36" and "lasting an hour".
- Description and root cause of unusual behavior:** States "VPN Client 10 received an unusual amount of data from internal resources. This behavior indicates that the VPN client might be compromised and transferring unauthorized information out of the network." It also notes "The VPN client received: 459.7GB from vpncenter.west10.example.com(192.168.72.198) over SSL:443".
- Adjusted risk score:** Notes "The risk score increased because of a highly privileged device."
- Participant roles and device names:** Shows an "OFFENDER" (VPN Client 10, 192.168.237.50, Site: West 5) and a "VICTIM" (proxy.example.com, 192.168.134.116, Site: West 5).
- Metric data:** A table showing network metrics:

Network Metric	6h Snapshot	1hr Peak Value	Expected Range	Deviation
Bytes In		356 GB	0 B-623 MB	56,997%
- Detection tracking and tuning options:** Includes "Actions" and "View Detection Details" links.

Risk score

Measures the [likelihood, complexity, and business impact](#) of a security detection. This score provides an estimate based on factors about the frequency and availability of certain attack vectors against the necessary skill levels of a potential hacker and the consequences of a successful attack. The icon is color coded by severity as red (80-99), orange (31-79), or yellow (1-30).

Participants

Identifies each participant (offender and victim) involved in the detection by hostname or IP address. Click on a participant to view basic details and access links. Internal endpoints display a link to the Device Overview page; external endpoints display the geolocation of the IP address, [endpoint lookup links](#) such as ARIN Whois and a link to the IP address detail page. If a participant has passed through another device like a load balancer or gateway, both the participant and the device are displayed on the participant card, but only the origin endpoint is considered a participant.

Note: SSL/TLS decryption is required to display origin endpoints if HTTPS is enabled. [Learn more about SSL/TLS decryption](#).

When grouping by **Type**, a summary panel appears under the detection type that breaks down detections by offender and victim and enables you to quickly [apply participant filters](#).

When grouping by **Source**, internal device role icons are highlighted red if the device was an offender in a detection and teal if the device was a victim. You can click **Details** under the source name to view a summary of detections where that source was a participant. These device details are displayed next to the detection card on wide screens (1900 pixels or greater).

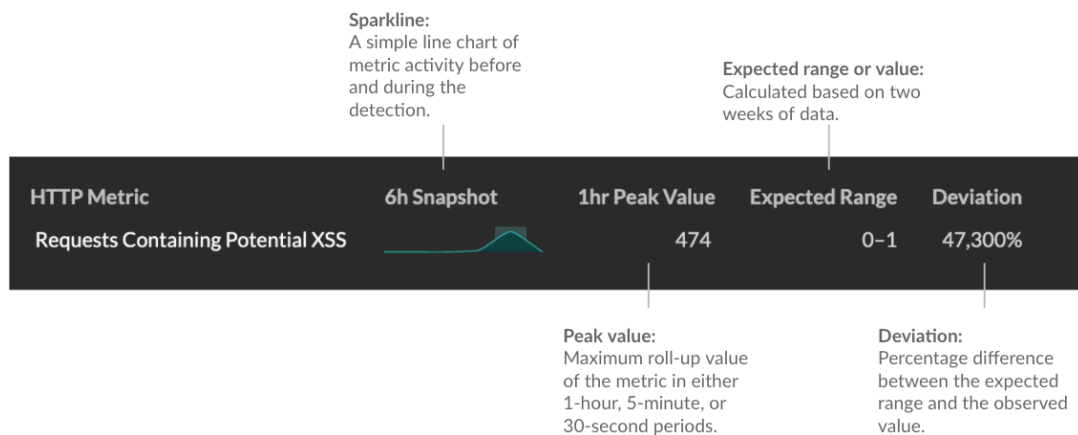

Duration

Identifies how long the unusual behavior was detected or displays ONGOING if the behavior is currently occurring.

Detections that highlight security hardening best practices display two dates: the first time and the most recent time that the violation was identified.

Metric data

Identifies additional metric data when the unusual behavior is associated with a specific metric or key. If metric data is unavailable for the detection, the type of anomalous protocol activity appears.

Detection management

You can [track](#) or [tune](#) the detection from the Actions dropdown list, or click **View Detection Details** to navigate to the detection detail page.

Detection detail page

Most of the data that you need to understand and validate a detection appears on the detection detail page: tables of relevant metric data, record transactions, and links to raw packets.

The detection card information is followed by all available sections for the detection. These sections vary depending on the type of the detection.

Track Detection

You can [track](#) or [tune](#) the detection, or click **Add to an Investigation** to include the detection in a new or existing [investigation](#).

If you have configured a [CrowdStrike integration](#) on your ExtraHop system, you can [initiate containment of CrowdStrike devices](#) that are participants in the detection. (Reveal(x) 360 only.)

Decryption badge

When the ExtraHop system identifies suspicious behavior or a potential attack in decrypted traffic records, the detection detail page displays a decryption badge to the right of the detection name.

CVE-2021-34527 Windows Print Spooler Exploit Attempt

83 RISK EXPLOITATION
Dec 8 12:17 • lasting a few seconds

dc05-west received a malicious request that matches an attempt to exploit PrintNightmare, a privilege escalation and remote code execution (RCE) vulnerability in the Windows Print Spooler service. Refer to this [Microsoft Security Update Guide](#) for patch and mitigation information

Related Detections

	Current Detection
T-2h	T-2h
T-2h	T-0

Activity map

Provides an [activity map](#) that highlights the participants involved in the detection. The activity map displays east-west traffic of the protocol associated with the detection to help you assess the scope of malicious activity. Click the victim or offender to access a drop-down menu with links to the Device Overview page and other detections where the device is a participant.

Detection data and links

Provides additional data associated with the detection to investigate. The types of data can include related metrics, links to [record](#) transaction queries, and a link to a general [packets](#) query. The availability of metrics, records, and packets vary by detection. For example, IDS detections include links to packets for all protocol types, but links to records are only available for L7 protocols.

Metric data and record transactions are displayed in tables. In a metrics table, click the icon  to view related record transactions. In a records table, click the icon  to view the related packet query for a transaction.

 **Note:** A [recordstore](#) must be configured to view transactions and continuous [packet capture](#) must be configured to download packets.

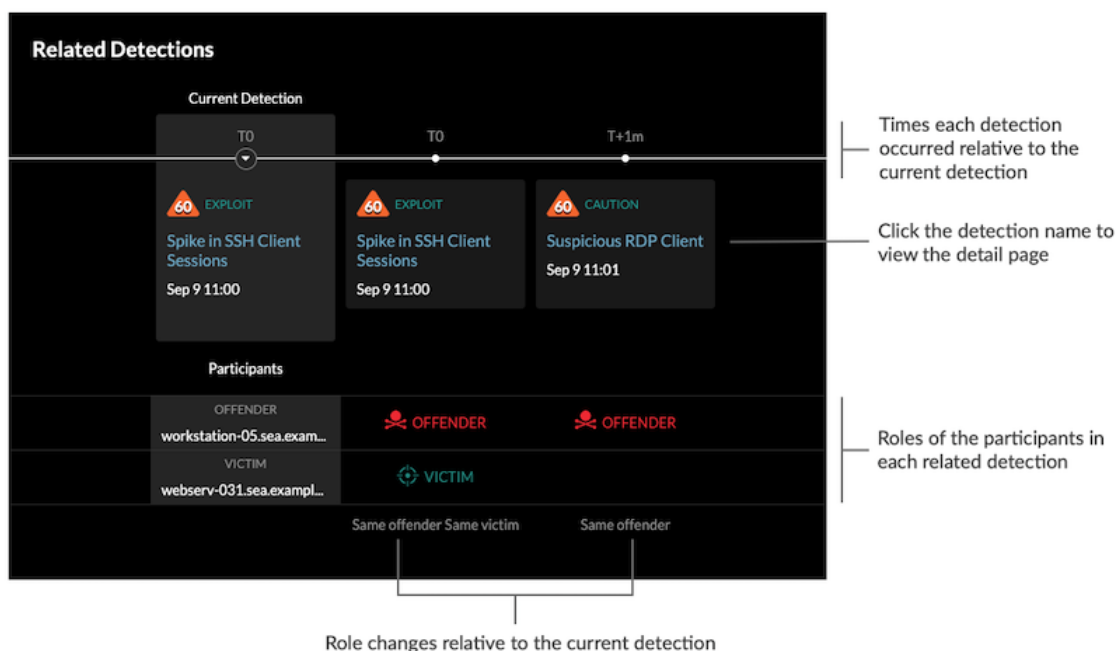

Compare behaviors

Provides a chart that displays the activity of the offender next to the activity of similar devices over the time period when the detection occurred. The chart appears for detections related to unconventional activity by a device, and highlights unexpected behavior by displaying it next to the behavior of devices on the network with similar properties.

Related detections

Provides a timeline of detections related to the current detection that can help you identify a larger attack campaign. Related detections include the participant role, duration, timestamp, and any role changes if the offender in one detection becomes the victim in a different detection. Click any related detection in the timeline to view the details page for that detection.

Detection details

Provides an expanded description of the detection, such as associated MITRE techniques, risk factors, attack backgrounds and diagrams, mitigation options, and reference links to security organizations such as MITRE.

These details are displayed next to the detection card on wide screens (1900 pixels or greater), or you can access them by clicking **Details** under the detection title when grouping the Detection page by **Types**.

The screenshot shows the 'Detections by Type' page. On the left, a list of detection types is shown with their counts: DCSync Attack (3), Shellshock HTTP Exploit Attempt (8), Microsoft Exchange Server SSRF and RCE Exploit (2), Data Exfiltration (5), and Unusual Sensitive Data Transfer. The right pane shows the 'DCSync Attack' details, including 'MITRE Techniques' (T1003 OS Credential Dumping) and 'Risk Factors' (Likelihood and Complexity).

Tip: You can [share detection](#) detail pages with other ExtraHop users.

Detection Catalog

The Detection Catalog provides a complete list of all detection types available in the ExtraHop system. You can also manage custom detection types from the Detection Catalog page.

You can access the Detection Catalog page by clicking the System Settings icon .

The screenshot shows a table of detection types. The columns are: Display Name, Author, Detection Type ID, Category, and MITRE Technique. A 'Create' button is in the top right corner. Annotations point to the 'Create' button ('Create a custom detection type') and the 'Author' column ('Built-in detections with ExtraHop as the author' and 'Custom detection with a username as the author').

Display Name	Author	Detection Type ID	Category	MITRE Technique
<input type="checkbox"/> Multiple SMB/CIFS Errors	ExtraHop	multiple_smb_cifs_errors	Storage	—
<input type="checkbox"/> NBT-NS Poisoning	ExtraHop	nbt_ns_poisoning	Exploitation	T1557: Man-in-the-Middle
<input type="checkbox"/> Network Privilege Escalation	ExtraHop	network_privilege_escalation	Lateral Movement	T1021: Remote Services
<input type="checkbox"/> Network Share Enumeration	ExtraHop	msrpc_network_share_enum	Reconnaissance	T1135: Network Share Discovery
<input type="checkbox"/> Network Segmentation Breach	garyp	network_segmentation_breach	Lateral Movement	T1098: Account Manipulation

In addition to the display name and author, you can filter the detection type list by detection type ID, detection category, MITRE techniques associated with the detection type, and detection types that support data from flow sensors.

Click on a built-in detection to view the Detection Type Settings panel, which displays the detection name, type, and associated categories. To learn more about the detection, click **Detection Type Details**.

Custom detections

You can view and manage custom detections from the Detection Catalog page.

- To create a custom detection type, click **Create** in the upper right corner of the page. The detection type ID for the new detection type must match the ID included in the custom detection trigger. Learn more about [creating a custom detection](#).
- To edit a custom detection, click the detection and edit the display name, author, detection categories, and associated MITRE techniques in the Edit Detection Type panel. You cannot edit built-in detections where ExtraHop is listed as the author.

- To delete a custom detection, click the detection, and then click **Delete** from the Detection Type Settings panel.

Investigations

(NDR module only) Investigations enable you to add and view multiple detections in a single timeline and map. Viewing a map of connected detections can help you determine whether suspicious behavior is a valid threat and if a threat is from a single attack, or part of a larger attack campaign.

You can create and add to investigations from a detection detail page or from the Actions menu on each detection card.

Each investigation page includes the following tools:

Investigation Timeline

The timeline appears on the left side of the page and lists the added detections in chronological order. New detections that are added appear in the timeline according to the time and date the detection occurred and relative to the earliest detection, which is labeled T0. Detection participants are displayed under the detection title and detection tracking information, such as assignee and status, is displayed next to the participants.

Click a detection in the timeline to view the [detection card](#) and highlight the detection participants in the investigation map. Click a participant on the card or in the investigation map to view basic details and links to the Device Overview page and other detections where the device is a participant.

In the upper right corner of the detection card click the go to [🔗](#) icon to view the [detection detail page](#), or the [x](#) icon to close the detection and return to the investigation timeline.

Below the detection card, click **Track Detection** to edit [detection tracking](#) information. You can click the timeline controls to view other detections in the investigation.

Investigation Map

The investigation map displays the offender and victim from every detection in the investigation. The participants are connected by lines that are labeled with the detection type, and device roles are represented by an icon.

- Click a detection in the investigation timeline to highlight participants. Circles are highlighted red if the device is the offender and teal if the device is the victim. Highlights are updated when you click a different detection to help you identify when a participant changes from victim to offender.
- Click a circle to view details such as the device hostname, IP address, or MAC address, or to navigate to associated detections or the [Device Overview page](#).
- Hover over any circle or line to display the label.

Notes

Click **Edit Investigation** to add notes or change the investigation name. You can continue to [track individual detections](#) after you add them to an investigation.

Navigating investigations

After a detection is added to an investigation, a link to the investigation appears at the bottom of the detection card and on the detection detail page.

Click the name to open the investigation and then click the name of the detection on the investigation page to return to the detection detail page.

Data Exfiltration to S3 Bucket

EXFILTRATION

Jan 29 00:00

lasting 3 hours

workstation10-south performed an unusual upload to an Amazon S3 (Simple Storage Service) bucket. This behavior is unusual based on the amount of transferred data and the time of the transfer. workstation10-south might be compromised and an attacker is attempting to exfiltrate data.

The risk score is higher than normal because one of the participants is a critical device.

OFFENDER

Finding detections in the ExtraHop system

While the Detections page provides quick access to all detections, there are indicators and links to detections throughout the ExtraHop system.

Note: Detections remain in the system according to your [system lookback capacity](#) for 1-hour metrics, with a minimum storage time of five weeks. Detections will remain in the system without supporting metrics if your system lookback capacity is less than five weeks.

- From a Device Overview page, click Detections to view a list of associated detections. Click the link for an individual detection to view the detection details page.
- From a Device Group Overview page, click the Detections link to go to the Detections page. The detections list is filtered to the device group as the source.
- From a device or device group protocol page, click the Detections link to go to the Detections page. The detections list is filtered to the source and protocol.
- On an activity map, click a device that displays animated pulses around the circle label to [view a list of associated detections](#). Click the link for an individual detection to view detection details.
- From a chart on a dashboard or protocol page, hover over a [detection marker](#) to display the title of the associated detection or click the marker to view detection details.
