

Sensor and console post-deployment checklist

Published: 2024-04-04

After you deploy an ExtraHop sensor or console, log in to the Administration settings on the ExtraHop system through `https://<extrahop-hostname-or-IP-address>/admin` and configure the following settings. Refer to the section of the [ExtraHop Admin UI Guide](#) specified in each action below, except where noted.

Password

Maintain system security after the evaluation period. Change the default password. For more information, see the [Default User Accounts FAQ](#).

NTP

Time is critical in the ExtraHop system, particularly when doing event correlation with time-based metrics and logs. Verify that the NTP settings are correct for your infrastructure, test settings, and sync NTP. For more information, see [Configure the system time](#).

Time Zone

The correct time zone is critical to run scheduled dashboard reports at the correct time. Ensure the ExtraHop system has the correct time zone. For more information, see [Configure the system time](#).

Remote Authentication

Set up remote authentication. The ExtraHop appliance integrates with [LDAP](#), [RADIUS](#), [SAML](#), and [TACACS+](#).

Firmware Update

The ExtraHop firmware is updated often with enhancements and resolved defects. Verify that you have the current firmware. For more information, see [Upgrade the firmware on your ExtraHop system](#).

Audit Logging

The ExtraHop system can send events to a remote syslog collector. For more information, see the [Send audit log data to a remote syslog server](#).

SMTP

The ExtraHop system can email alerts and system-health notifications. Set up and test notifications. For more information, see [Configure email settings for notifications](#).

System Notifications

The ExtraHop system can send email when it detects problems. Create an email group to receive notifications. For more information, see [Configure an email notification group](#).

iDRAC

Each physical ExtraHop appliance has an iDRAC port, similar to iLO or KVM over Ethernet. Connect and configure the iDRAC port. For more information, see [Configure the iDRAC Remote Access Console](#).

SSL Certificate

Each ExtraHop system ships with a self-signed certificate. If you have a PKI deployment, generate your own certificate and upload it to each ExtraHop system. For more information, see the [SSL Certificate](#) section.

DNS A Record

It is easier to access an ExtraHop system by hostname than by IP address. Create an A record in your DNS root ("`exa.yourdomain.local`") for each ExtraHop system in your deployment. Refer to your DNS administration manual.

Disk Encryption

Enable security on storage drives to provide encryption on virtual disks (EDA 9300, EDA 10300, and IDS 9380 only). For more information, see [Configure self-encrypting disks \(SEDs\)](#).

Connect Appliances

Connect the console and sensors to all packetstores and recordstores. For more information, see [Connect the console and sensors to ExtraHop recordstores](#) and [Connect sensors and console to the packetstore](#).

Cloud Services

Connect to ExtraHop Cloud Services to enable Detections and Remote Access. For more information, see [Connect to ExtraHop Cloud Services](#).

Threat Intelligence

Configure threat intelligence settings to identify indicators of compromise on your network. For more information, see [Threat intelligence](#).

Network Localities

Classify non-RFC1918 IP addresses as part of your internal network. For more information, see [Specify a network locality](#).

Tuning Parameters

Help improve the quality and accuracy of rules-based detections by adding tuning parameters. For more information, see [Specify tuning parameters for detections and metrics](#).

Advanced Analysis

Target specific device groups or activity groups for Advanced Analysis as needed, based on their importance to your network. For more information, see [Analysis priorities](#).

Decrypt SSL Traffic

Decrypt forwarded SSL traffic by uploading the private key and server certificate associated with that traffic. For more information, see [Decrypt SSL traffic with certificates and private keys](#).

Configure Perfect Forward Secrecy (PFS)

Decrypt SSL/TLS traffic from your Linux and Windows servers. For more information, see [Install the ExtraHop session key forwarder on a Linux server](#) and [Install the ExtraHop session key forwarder on a Windows server](#).

Customizations and Datastore Backup

Create a system backup prior to upgrading firmware, or before making a major change in your environment. For more information, see [Back up a Sensor or ECA VM](#).
