Mirror Wire Data with VMware

Published: 2023-09-30

The ExtraHop virtual sensor can be configured to monitor network traffic in the following network configuration examples.

- Monitoring traffic on multiple network interfaces or VLANs with ERSPAN
- Monitoring Intra-VM Traffic
 - One virtual interface on the EDA 1100v
 - Up to three virtual interfaces on the EDA 6100v
- Monitoring external mirrored traffic to the VM
- Monitoring external mirrored traffic to the VM (EDA 6100v)
- Monitoring both intra-VM and external mirrored traffic to the VM (EDA 6100v)

Note: Monitoring external network-mirrored traffic requires an external NIC and an associated virtual switch.

Monitoring traffic on multiple network interfaces or VLANs with ERSPAN

This scenario requires you to configure an interface on the ExtraHop system to receive ERSPAN traffic and configure the VMware server to mirror traffic from specified ports.

See Configure ERSPAN with VMware 🛛 for configuration details.

Monitoring intra-VM traffic

This scenario requires a second VM port group on the default virtual switch of the ESX host for monitoring traffic within the virtual switch as well as external traffic in and out of the switch.

- 1. Start the VMware vSphere client and connect to your ESX server.
- 2. Select the ESX host at the top of the tree control in the left panel and then click the **Configure** tab.
- 3. In the **Networking** section, click Virtual Switches.

immary Monitor Co	rigure Permissions VMs Resource Pools Datastores Networks		
Storage Storage Adapters Storage Devices	Virtual switches Standard Switch: vSwitch0 ADD NETWORKING EDIT MANAGE PHYSICAL ADAPTERS ····	ADD NETWORKING	REFRESH
Protocol Endpoints VO Filters Networking Virtual switches VMkernel adapters TCP/IP configuration Virtual Machines VM Startup/Shutdo_ Agent VM Settings Default VM Compati_ Swap File Location]	
System Licensing Host Profile Time Configuration	Standard Switch: vSwitch2		

- 4. To add a port group to the vSwitch0, click **Add Networking**. The Add Networking window appears.
- 5. Select Virtual Machine Port Group for a Standard Switch as the connection type and then click Next.

1 Select connection type 2 Select target device	Select connection type Select a connection type to create.
4 Ready to complete	VMkernel Network Adapter
	The VMkernel TCP/IP stack handles traffic for ESXi services such as vSphere vMotion, iSCSI, NFS, FCoE, Fault Tolerance, vSAN and host management.
	Virtual Machine Port Group for a Standard Switch
	A port group handles the virtual machine traffic on standard switch.
	O Physical Network Adapter
	A physical network adapter handles the network traffic to other hosts on the network.

6. In the Select target device step, choose **Select an existing standard switch** and then click **Next**. The default switch is vSwitch0.

Select connection type 2 Select target device	Select target device Select a target device	for the new connection.		
Connection settings	 Select an existing 	standard switch		
	vSwitchO			BROWSE
	O New standard swi	tch		
	MTU (Bytes)	1500		
			CANCEL	BACK

7. In the Connection settings step, assign a unique name to the new port group, click the VLAN ID dropdown menu, and select All (VLAN 4095).

1 Select connection type 2 Select target device 3 Connection settings	Connection settings Use network labels to hosts.	o identify migration-com	npatible connections co	mmon to two or more	
4 Ready to complete	Network label	Network label Local Port Mirror			
	VLAN ID	All (4095)	•		

- 8. Click Next.
- 9. Click Finish.
- 10. Set the Remote Port Mirror to Promiscuous Mode as follows.
 - a) In the vSwitchO section, click the edit menu icon ... next to the new port group and click **Edit**.
 - b) Click Security.
 - c) Select the override checkbox next to Promiscuous mode set the Promiscuous Mode to **Accept**, and then click **OK**.

ocal Port Mirror - E	dit Settings			
Properties Security	Promiscuous mode	Override	Accept	~
affic shaping	MAC address changes	Override	Accept	~
aming and failover	Forged transmits	Override	Accept	~

- 11. Click **VMs** from the top menu.
- 12. Right-click the name of the sensor virtual machine and click Edit Settings.
- 13. Click Network Adapter 2.
- 14. Select **Browse** from the drop-down menu.
- 15. Click Local Port Mirror, and then click OK.

Select Network

- 16. Verify that Local Port Mirror appears next to Network Adapter 2 in the Edit Settings window, and then click **OK**.
- 17. Restart the sensor to activate the new adapter setting.

Monitoring external mirrored traffic to the VM

This scenario requires a second physical network interface and the creation of a second vSwitch associated with that NIC. This NIC then connects to a mirror, tap, or aggregator that copies traffic from a switch. This setup is useful for monitoring the intranet of an office.

- 1. Start the VMware vSphere client and connect to your ESX server.
- 2. Select the ESX host at the top of the tree control in the left panel and then click the **Configure** tab.
- 3. Click Networking.

exampleium.	testing.exa	ample.com	ACT	IONS -

17. Restart the ExtraHop VM to activate the new adapter setting.

Monitoring external mirrored traffic to the VM (EDA 6100v)

In this scenario, you must create a third and fourth physical network interface and two more vSwitches associated with those NICs. These NICs then connect to a mirror, tap, or aggregator that copies traffic from a switch.

- 1. Start the VMware vSphere client and connect to your ESX server.
- 2. Select the ESX host at the top of the navigation tree in the left panel and then click the **Configure** tab.
- 3. Click Networking and then click Add Networking.
- 4. Select Virtual Machine Port Group for a Standard Switch as the connection type and then click Next.
- 5. In the Select target device step, choose **Select an existing standard switch** and then click **Next**. The default switch is vSwitch0.
- 6. In the Connection settings step, assign a unique name to the new port group (Remote Port Mirror 2, for example), click the VLAN ID drop-down menu, and select All (VLAN 4095).
- 7. Click **Next** and then click **Finish**.
- 8. Set the Remote Port Mirror to Promiscuous Mode as follows.
 - a) Click **Edit** next to vSwitch2.
 - b) Click the Security tab, set the Promiscuous Mode to Accept, and then click OK.

Note: Mac address changes and Forged transmits are set to **Accept** by default. You can change these settings to **Reject** if required for your environment.

- 9. In the left panel, select the ExtraHop virtual sensor.
- 10. Click the Actions drop-down menu and then select Edit Settings....
- 11. Click **Network Adapter 3** and then click **Browse...** from the drop-down menu.
- 12. Click Remote Port Mirror 2, and then click OK.
- 13. Repeat steps 3 through 10 to add a fourth vSwitch.

14. Restart the ExtraHop VM to activate the new adapter setting.

Monitoring both intra-VM and external mirrored traffic to the VM (EDA 6100v)

In this scenario, you can monitor a mix of intra-VM and external mirrored traffic on up to three virtual interfaces.

- 1. To monitor intra-VM traffic on one or more virtual interfaces, create a VM port group on the default virtual switch of the ESX host for each interface as described in Monitoring Intra-VM Traffic.
- 2. To monitor external mirrored traffic on one or more virtual interfaces, create a physical network interface and corresponding vSwitch for each interface as described in Monitoring External Mirrored Traffic to the VM.
- 3. Click **Network Adapter x** and select an option from the **Network label** drop-down list for each interface.

Mirroring VLANs

To mirror VLANs, you must either set the destination port on the port mirror configuration to VLAN Trunking or set the exact VLAN ID on the ports of the VLANS you are mirroring.
