

Open Data Streams

Published: 2024-04-10

An open data stream (ODS) is a channel through which you can send specified metric data from a sensor to an external, third-party system. For example, you might want to store or analyze metric data with a remote tool, such as Splunk, MongoDB, or Amazon Web Services (AWS).

Sending data through an open data stream is a two-step procedure. First, you configure a connection to the target system that will receive the data. Second, you write a trigger that specifies what data to send to the target system and when to send it.

You configure an ODS target through the Administration settings, which requires a user account with system and access administration privileges. You can configure up to 16 ODS connections for each of the following target types:

- HTTP
- Kafka
- MongoDB
- Syslog
- Raw data

The Open Data Streams page in the Administration settings displays configured targets organized by type similar to the following figure:

Open Data Streams

[Add Target](#)

HTTP ▾

Name ▾	Host ▾	Port ▾	Type ▾	Pipelining ▾	Additional Header ▾	Authentication ▾	Status
default	0.0.0.0	80	http	—	—	none	● OK Edit ✖
CloudWatch	monitoring.us-west-2.amazonaws.com	80	http	—	—	aws	● OK Edit ✖

Each target displays the specified configuration settings and enables you to check the connection status, and edit or delete the target.

Status

The Status column displays "OK" if the ExtraHop system is able to connect to the target. Otherwise the status is "Error" or "Offline".

Hover over the status to view details about the connection. If there is no correlating ODS trigger or the trigger is not running, the window displays an inactive status. If the connection is active, the window displays metrics such as the number of messages and bytes sent and received and the number of connection attempts, similar to the following figure:

● [OK](#)

```

Connection Status

HTTP/1.1 200 OK Content-Length: 212
Content-Type: text/xml Date: Wed, 07 Dec 2016
21:44:03 GMT X-Amzn-Requestid: 45be13a4-

Metrics since Sat Jan 17 1970 19:25:43
GMT-0800 (PST)
-----
Messages received by exremote      1
Bytes received by exremote         4
Messages sent to target            1
Bytes sent to target               0
Messages dropped by exremote       0
Connection attempts               1
Connection errors                  0
IPC errors                         0
Message send errors                0
    
```

Requests from an ODS trigger to transmit data to the target are asynchronous; there is no support for processing responses to verify the success of a request. The connection details can help you check that the ODS trigger is running and that data is successfully transmitted.

Edit

You can edit any of the target settings except the target name. Because the target name is referenced by the trigger that specifies what data to send through the open data stream, this restriction reduces errors.

Delete

When you delete a target, it is important to also delete or inactivate the correlating ODS trigger; otherwise, the trigger continues to run and consume resources.

After you configure an ODS target, you must create a trigger that specifies what data to manage through the stream. For example, after you create an HTTP target, you might create a trigger that collects the processing time of HTTP responses on a handful of devices, and then sends the metric data to the target.

For more information, see [Open data stream classes](#) in the [ExtraHop Trigger API Reference](#).
