

Find and filter detections

Published: 2018-10-10

You can filter detections by time interval, protocol, category, applications, or devices. Detections are sorted by their start time and the most recent detection is listed first.

 **Note:** Detections require a [connection to the cloud-based ExtraHop Machine Learning Service](#).

1. Log into the Web UI on a Discover or Command appliance, and then click **Detections** at the top of the page.
A list of detections for the current time interval appears. If the list is empty, the Machine Learning Service has not identified detections for the selected time interval.
2. In the left pane, filter detections by selecting the options as shown in the following figure:

The screenshot shows a filter pane on the left side of the interface. It includes a time interval selector set to 'Last 7 days', a 'Discover Appliances' dropdown set to 'Any Appliance', a 'Protocols' dropdown set to 'Any Protocol', a 'Sources' input field containing 'VMware 521E98' with an 'Add Source' button below it, a 'Category' section with 'Any' selected and 'IT Operations (10)' and 'Network Infrastructure (10)' as options, and a 'Source Type' section with 'Any' selected and 'Devices (10)' as an option. Lines connect these elements to explanatory text on the right.

- Time Interval:** Change the time interval to view detections from a different time period.
- Discover Appliances:** From a Command appliance, click the name of the Discover appliance to view detections for applications or devices on that appliance.
- Protocols:** Click one or more protocols and then click outside the drop-down list to filter detections by protocols.
- Sources:** Search for and select one or more sources to filter detections by specific sources.
- Category:** Click to filter detection by security or performance (IT operations) categories; which categories are available depend on your license.
- Source Type:** Click to filter detections by device or application.
